DEPARTMENT OF COMPUTER SCIENCE,

JSS COLLEGE OF ARTS COMMERCE AND SCIENCE

OOTY ROAD MYSURU-570025

Introduction

CodeFlow is a modern, web-based platform designed to eliminate these limitations by integrating a multi-language online code editor with a real-time chat and social networking system. Built using Next.js, React, and Monaco Editor, the coding environment provides IDE-like features such as syntax highlighting, autocompletion, formatting, and error detection. Code execution is handled through the Piston API, ensuring secure, sandboxed, cloud-based multi-language compilation and execution.

The platform also integrates a real-time chat system built using the MERN stack and Stream Chat SDK, enabling messaging, notifications, and audio-video calling. By unifying coding and communication within a single environment, CodeFlow enhances collaborative learning, peer interaction, and developer productivity, making it ideal for students, educators, and professional teams.

Aim

To design and develop CodeFlow, a unified cloud-based platform that integrates a multi-language online code editor, real-time chat system, audio-video communication, AI-powered assistance, and social networking features to enhance collaborative coding, learning efficiency, and seamless developer interaction.

Scope and Objectives

- **Develop a Unified Development Platform**
To design and implement a web-based system that combines coding, communication, and collaboration tools in a single environment.

- **Enable Cloud-Based Multi-Language Code Execution**
To allow users to write, compile, and execute programs directly in the browser without local installation.

- **Provide Real-Time Communication**
To integrate secure one-to-one and group messaging, enabling instant collaboration among users.

- **Support Audio and Video Calling**
To allow real-time communication through video call link generation and calling features.

- **Implement AI-Based Academic Assistance**
To integrate an AI ChatBot that assists users with debugging, code explanation, and exam preparation.

- **Promote Social Networking and Collaboration**
To enable friend discovery, profile management, and persistent collaboration history for long-term engagement.

Existing System:

In traditional software development environments, users rely on locally installed IDEs and compilers that require complex setup procedures and frequent updates. Beginners often struggle with installation and configuration issues, while advanced developers face dependency conflicts and platform inconsistencies.

Communication and collaboration tools typically function separately from coding platforms. Developers must switch between editors, messaging applications, and video conferencing tools, which interrupts workflow and reduces productivity.

Most online chat platforms lack structured networking features such as profile onboarding, friend discovery, and integrated collaboration history. Additionally, many online code editors provide limited functionality and do not offer secure cloud-based execution environments.

Disadvantages of Existing System

- **Complex Environment Setup**
  Requires local installation of IDEs and compilers, leading to configuration and compatibility issues.
- **Platform Dependency Issues**
  Different operating systems create inconsistent development experiences.
- **Separation of Coding and Communication Tools**
  Users must switch between multiple applications, disrupting workflow.
- **Limited Collaboration Features**
  Most platforms do not support integrated messaging, calling, and code sharing.
- **No Unified Networking System**
  Lack of structured user discovery, friend management, and persistent interaction history.

Proposed System

The proposed CodeFlow platform provides a unified, cloud-based development and communication system. Users can write, edit, and execute code directly in the browser using a Monaco Editor-based IDE that supports multiple programming languages with syntax highlighting, formatting, and autocompletion features.

Code execution is performed securely using the Piston API, which ensures sandboxed and isolated runtime environments. The real-time chat module, powered by the Stream Chat SDK, enables one-to-one messaging, group chats, typing indicators, and notifications.

Users receive:

- Multi-language online coding and execution
- Real-time chat and collaboration
- Audio and video calling support
- Persistent code storage
- Profile management and user discovery
- AI-powered debugging and academic assistance

The AI ChatBot module assists users with programming queries, debugging guidance, concept explanations, and exam preparation. The dashboard provides friend recommendations, messaging shortcuts, and theme management. The onboarding system ensures structured profile completion and synchronization with chat services.

Advantages of Proposed System

- **Integrated Development and Communication Platform**
  Combines coding, chat, calling, and networking in a single system.
- **Cloud-Based Code Execution**
  Eliminates local installation requirements and ensures platform independence.
- **Real-Time Collaboration**
  Enables instant messaging and group communication for better teamwork.
- **Multi-Language IDE Features**
  Supports various programming languages with syntax highlighting and autocompletion**.**
- **AI-Powered Learning Support**
  Provides intelligent debugging guidance and academic assistance.
- **Social Networking Features**
  Allows friend discovery, profile onboarding, and long-term collaboration tracking.

Minimum Requirements For Development:

- **Hardware Requirements**
  - System: Intel i3 or higher
  - RAM: 4 GB or more
  - Hard Disk: 200 GB or more
  - Internet connection 2mb/s
- **Software Requirements**
  - Operating System: Windows 10 or higher
  - Programming Language: JavaScript / TypeScript
  - Front-End: React, Next.js, Tailwind CSS
  - Backend: Node.js, Express.js

- Database: MongoDB
- Authentication: Clerk / JSON WEB TOKENS
- Code Editor: Monaco Editor
- Code Execution API: Piston API
- Chat SDK: Stream Chat
- AI API: Gemini / OpenAI API

Modules

1. Onboarding Module

This module allows users to register and create their profiles securely within the platform. Users can complete their bio, select preferred programming languages, and update personal details. Proper field validation ensures accurate data entry and smooth profile management. The module synchronizes user information with chat services to enable seamless communication setup. It provides a structured entry point for new users joining CodeFlow. This module allows users to register and create their profiles securely within the platform. Users can complete their bio, select preferred programming languages, and update personal details. Proper field validation ensures accurate data entry and smooth profile management. The module synchronizes user information with chat services to enable seamless communication setup. It provides a structured entry point for new users joining CodeFlow.

2. Dashboard Module

This module serves as the main interface of the platform, offering a responsive sidebar and top navigation bar. It displays the friends list, messaging shortcuts, notifications, and user recommendations. Users can easily navigate to different features such as the code editor, chat, type speed test, and AI ChatBot. Theme management options are also included to enhance user experience. The dashboard ensures organized and efficient access to all platform functionalities.

3. Real-Time Chat Module

This module enables secure one-to-one and group messaging between users. It supports threaded conversations, typing indicators, and real-time notifications for better interaction. Integration with Stream Chat SDK ensures reliable and token-based authenticated communication. The module also supports video call link generation and real-time audio-video communication. It enhances collaboration and peer-to-peer learning within the platform.

4. Integrated Code Editor Module

This module provides a Monaco Editor-based online IDE that supports multiple programming languages. It includes features such as syntax highlighting, autocompletion, formatting, and error detection to improve coding efficiency. Code is automatically saved locally to prevent data loss. The module integrates with the Piston API for secure, sandboxed cloud-based code execution. A terminal-style output console displays compilation and execution results clearly.

5. Type Speed Test Module

This module helps users improve their typing speed and accuracy through structured practice. It generates random text based on selected difficulty levels. Real-time accuracy tracking and Words Per Minute (WPM) calculation provide performance insights. Anti-cheating mechanisms ensure fair assessment. The module enhances productivity skills essential for developers.

6. User Management Module

This module manages friend requests, social connections, and user interactions. It allows users to send, accept, or reject friend requests within the platform. Notifications keep users informed about social activities and updates. Profile management features enable easy editing of personal details. The module promotes networking and long-term collaboration among users.

7. AI ChatBot Module

This module acts as an intelligent academic and programming assistant. It provides debugging support, code explanations, and concept clarification for various programming languages. The AI assistant also helps with exam preparation and technical interview guidance. It is integrated directly within the platform for quick access during coding sessions. This module enhances learning efficiency and problem-solving capabilities.
